**BLOCK PAVING - PATIO SLABS - TARMACADAM
GRAVELING - BRICKWORK - FENCING - NATURAL STONE
DRAINAGE - TURFING - LANDSCAPING**

**FREE ESTIMATES & ADVICE
ALL WORK FULLY GUARANTEED**

Our block paving will not crack, dip or subside due to the specification of sub base, the quality of materials used and professional installation giving you permanent peace of mind.

Every driveway and patio we design and install is built to last, we stake our reputation on it, hence, unlike many other companies, our driveways and patios come with a guarantee.

Add a new driveway

Add elegance, strength and a lot more besides

You can be sure that we will create for you a beautiful, individual approach to your home that will last for generations to come.

We raise the standard when building you a driveway! What you see on top will look fabulous thanks to the tremendous designs we have in our range, the quality of the blocks themselves, the detailing and, of course, the attention we take from design to construction.

But what you do not see is equally important - in fact, probably more so. Enormous care goes into the design, preparation and construction of the foundations for your driveway. Building it properly means that it will be able to handle surface and storm water in line with planning regulations. Ensuring that the base and sub-base are strong enough, level enough and properly compacted to our own rigidly laid down standards means a driveway that is more stable, stronger and less prone to subsidence, even after years of use.

Every member of our team of advisers, designers and installers is dedicated to ensuring that your driveway exceeds every requirement and expectation.

The new legislation that has been introduced to tackle the issues of flooding and other environmental concerns mean you may need

planning permission for some situations and types of new driveway and will always need to ensure that surface water can drain away efficiently without contributing to flood risks.

As leaders in the field, we confront this issue in two ways that each take into account the type of soil you have and the design of your drive: namely by constructing you an efficient soakaway that is big enough to cope with your surface water, even in a heavy storm, or by using our remarkable new Porlock permeable blocks that, in line with SUDS, allow rain water to pass straight into the prepared sub-surface below, reducing the risk of flooding.

1. Excavation
We dig out the area to correct depth and dispose of soil. Prepare and install necessary drainage.

2. Edge Course
The edge restraint is laid on a sturdy concrete foundation around the perimeter.

3. Lining The Base
A thick geotextile membrane is laid on the soil base to prevent the sub base mixing with the underlying layers. It can also help prevent weed growth.

4. Sub Base
We supply and lay a suitable hardcore to give a solid base for the driveway.

5. Laying Course
We then spread, level and compact laying course sand, and screed to correct level..

6. Block Laying
Paving blocks are then laid in the customers choice of colour and pattern.

7. Cut & Fill
Next we measure and cut the final blocks to size and fill the joints.

8. Jointing & Compaction
Kiln-dried jointing sand is spread over the block surface and swept into the joints using a soft brush and then compacted with a wacker plate

9. Completion
Excess jointing sand can be swept off the surface and it is now ready to be used.

Before

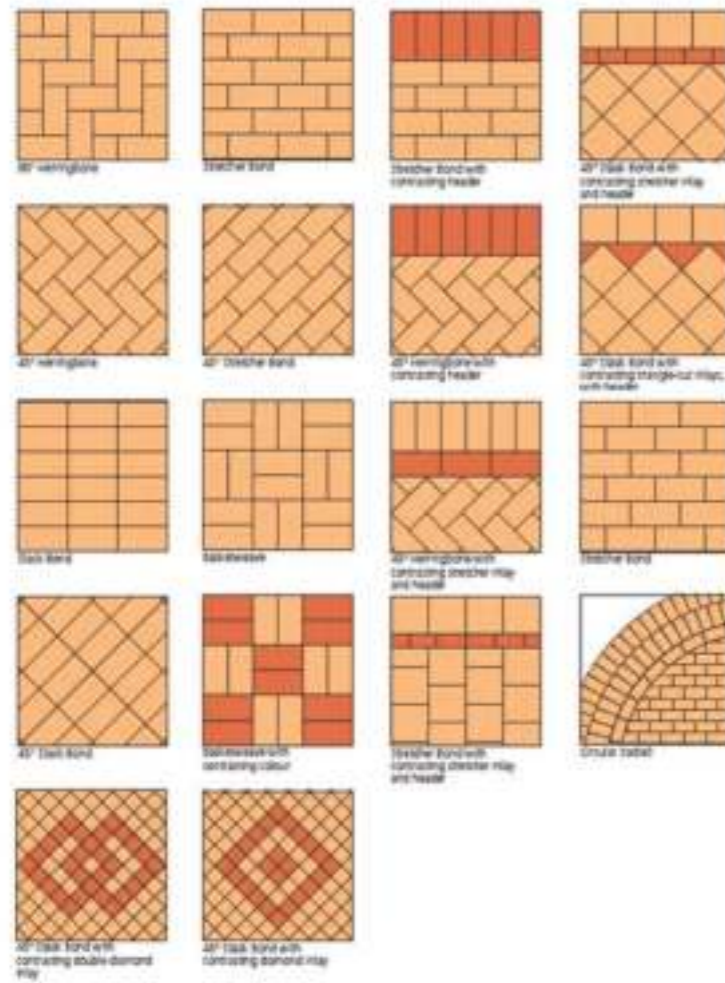

After

Marshall's Standard Concrete Block Paving is the perfect budget option for any property type, offering a practical, longer-lasting and more attractive alternative to resin or asphalt products.

A cost effective block paving option, suitable for any style of home
 Add some natural charm and texture with the coarse surface finish
 Excellent alternative to resin or asphalt paving
 Choose from seven popular colours to create your ideal driveway

Recessed Manhole Covers
 Recess tray covers, sometimes referred to as "Inset covers", are used within paved area to disguise the presence of manholes, inspection chambers and access fittings. Within an area of decorative, coloured or natural stone paving, they are invaluable, especially compared against the utilitarian covers commonly used in modern construction.

Linear Drainage Channels
 The Linear Drain Channel is an easy and effective way of removing unwanted standing water into a domestic drain. The protective grate is high-heel and child friendly, and the product sits flush with the floor, allowing for the passage of vehicles on a driveway. They can be fitted on driveways, patios and paths around the home and will work with any type of paving from block and flagstones to tarmac or concrete.

Kerbs play an essential part in both your driveway and garden design, performing a number of functions and adding the finishing touch.

There are complementary kerbs to suit all paving ranges. All our kerbs can be laid in a variety of positions by simply rotating the unit to suit.

By incorporating raised kerbs into your driveway or garden area, you will add real character and make your drive unique.

Edgings for driveways and garden areas come in all sorts of shapes, sizes and materials. The reasons for using an edging are manifold, but usually include one or more of the following...

- To restrain the paving, keeping it in place - as with block paving
- To create a step up or down between the paving and another surface
- To create 'check' that keeps traffic on the driveway
- To allow garden soil and/or turf to be kept separate from the paving
- To keep vegetation/weeds out of the paving
- Purely Decorative

The Sandstone 22mm Collection

One of the unique qualities with our natural stone is the subtle colour variation running through each stone, with differing riven profiles.

We always advise that you visit your local stockist to appreciate the varied colour tones and the beautiful natural characteristics of the stone.

Pack & Single Sizes Information	Pcs Per Pallet	M2 Per Pallet
